

# Update on Prostate Cancer: New Developments in Diagnosis, Grading, Staging and Reporting

**Rajal B. Shah, M.D.**  
**Director, Urologic Pathology**  
[SHAHR6@ccf.org](mailto:SHAHR6@ccf.org)  
**@rajalbshah**

Case 1

# Diagnosis

- Cribriform HGPIN
- Intraductal carcinoma (IDC-P)
- Atypical intraductal proliferation (AIP)
- Prostate adenocarcinoma, Gleason score 4+4, GG 4

Case 2

# Diagnosis

- Prostate adenocarcinoma, Gleason score 3+3=6, GG 1 with HGPIN
- Prostate adenocarcinoma, Gleason score 3+4=7, GG 2
- Prostate adenocarcinoma, Gleason score 4+3=7, GG 3
- Prostate adenocarcinoma, Gleason score 3+3, GG 1 with intraductal carcinoma (IDC-P)

**Case 3**

# Diagnosis

- Prostate adenocarcinoma, Gleason score  $3+3=6$ , GG 1
- Prostate adenocarcinoma, Gleason score  $3+4=7$ , GG 2
- Prostate adenocarcinoma, Gleason score  $4+3=7$ , GG 3
- Prostate adenocarcinoma, Gleason score  $4+4=8$ , GG 4

**Case 4**

# Diagnosis

- Prostate adenocarcinoma, Gleason score  $3+3=6$ , GG 1
- Prostate adenocarcinoma, Gleason score  $4+3=7$ , GG 3
- Prostate adenocarcinoma, Gleason score  $4+5=9$ , GG 5
- Prostate adenocarcinoma, Gleason score  $5+4=9$ , GG 5

# Important Changes in Prostate Cancer Classification, Grading, Staging and Reporting

- New entities

  - Intraductal carcinoma of the prostate (IDC-P)

- Grading

  - Modifications of grading and Grade groups

  - Cribriform architecture

- Reporting

  - Tertiary pattern, % pattern 4, Multifocal tumors

- Staging

  - pT2 no longer substaged into pT2a-c

# **Intraductal Carcinoma of the Prostate (IDC-P)**

## **Histological Features**

### **Hallmarks**

- 1. Expansile proliferation of PCa cells**
  - Cribriform or solid architecture**
- 2. Within native prostate glands**
  - Basal cell layer at least partially preserved**

**Many atypical  
cribriform/solid glands**

**Partially involves native  
benign glands**

# Diagnostic Criteria for IDC-P

(Guo CC and Epstein JI, *Mod Pathol.* 2006)

**Large glands with lumen-spanning atypical cells  
and preserved basal cells**

|

**Solid architecture  
*or*  
Dense cribriform  
*or*  
Marked atypical nuclei  $>6X$  adjacent benign nuclei  
*or*  
Non-focal comedonecrosis**

**YES**

**NO**

**IDC-P**

**Atypical intraductal proliferation**

**Dense cribriform:  
Irregular lumina**

**Dense cribriform:  
Punched out lumina**

**Solid**

**Dense cribriform with comedonecrosis**

## Histopathologic criteria for IDC-P

Expansile growth of malignant cells filling prostatic ducts/large acini  
+  
Preservation of basal cells

Solid

Dense Cribriform

Loose Cribriform

Micropapillary

+

Non-focal comedonecrosis ( $\geq$  two glands)  
or  
Marked nuclear atypia (nuclear size  $\geq$  6  
times that of adjacent benign nuclei)

IDC-P

Morphologic Architecture

**You require nuclear criteria or comedonecrosis when there is no dense or solid architecture!**

**Marked variation in  
nuclear size**

**Pleomorphic nuclei  
>6X adjacent nuclei**

# **Intraductal Carcinoma of the Prostate (IDC-P)**

## **Diagnostic Criteria**

- **Use a constellation of morphological features (architecture and cytology)**
- **Use stringent diagnostic criteria to ensure its unique clinical implication, ie, association with adverse outcomes**
- **Any atypical expansile, lumen-spanning lesion warrants further work-up**

# **Significance of IDC-P in Prostate Biopsy**

# INTRADUCTAL CARCINOMA OF THE PROSTATE : OUTCOME

- Independent predictor of various adverse outcomes
- Contemporary studies focusing on outcomes lump cribriform Gleason pattern 4 and IDC-P as “cribriform architecture”
- Isolated intraductal carcinoma in prostate biopsy : Definitive therapy may be indicated although 10% of patients will have intraductal carcinoma only at radical prostatectomy, so repeat biopsy is an option

# **Differential Diagnosis of Intraductal Carcinoma of the Prostate**

## **(DDX for Atypical Cribriform/Solid Lesions)**

- **High grade PIN**
- **Atypical Intraductal Proliferation (AIP)**
- **Invasive cribriform prostatic carcinoma**
- **Ductal adenocarcinoma of the prostate**
- **Urothelial carcinoma involving the prostate**
- **Metastatic (colorectal) adenocarcinoma**

# IDC-P vs Cribriform HGPIN

**IDC-P**

✓ Atypical cribriform lesion with basal cells intermixed with or within 3 mm from the border of PCa

**Cribriform HGPIN**

✓ Atypical cribriform lesion with basal cells > 3 mm from the border of PCa

# Morphological Difference b/w of IDC-P and Cribriform HGPIN

(Shah, Magi-Galluzzi, Han, Zhou, AJSP 2010)

# cases		IDC-P	Cribriform HGPIN	P value
		43	23	N.A.
# atypical cribriform lesion /prostate	Mean	23.8	2.4	0.002
	Range	1-143	1-6	
Smallest size (mm)	Mean± S.D.	0.34 ± 0.19	0.33 ± 0.13	0.848
	Range	0.2-1.1	0.2-0.6	
Largest size (mm)	Mean± S.D.	1.5 ± 1.3	0.43 ± 0.15	0.002
	Range	0.4-2.5	0.2-1.0	
Glandular contour	Regular	29 (67.4%)	19 (82.6%)	0.187
	Irregular	34 (79.1%)	12 (52.2%)	0.023
	Branching	36 (83.7%)	1 (4.3%)	< 0.001
Architecture	Irregular cribriform	41 (95.3%)	23 (100%)	0.293
	Dense cribriform or solid	10 (23.3%)	0 (0%)	0.01
Comedo necrosis		14 (32.6%)	0 (0%)	0.001
Nuclear features	Uniform	15 (34.9%)	14 (60.9%)	0.036
	Variable	22 (51.2%)	9 (29.1%)	0.35
	> 6X or pleomorphic	12 (27.9%)	0 (0%)	0.005

# Morphological comparison between IDC-P and HGPIN

- Morphologic criteria for IDC-P has high specificity but poor sensitivity
- There is significant overlap at “lower grade” morphological spectrum (HGPIN and AIP)

# IDC-P vs Cribriform HGPIN

**IDC-P**

**Cribriform HGPIN**

- ✓ ERG gene fusion: 75%
- ✓ ERG fusion status concordant between IDC-P and adjacent PCa in 100% cases

- ✓ ERG gene fusion: 0%

- IDC-P and cribriform HGPIN are genetically distinct
- ERG gene status identical between IDC-P and PCa
  - ✓ IDC-P : resulting from intraductal spread of PCa

# MOLECULAR FEATURES OF INTRADUCTAL CARCINOMA

Study	ERG expression		PTEN loss	
	HGPIN	IDC-P	HGPIN	IDC-P
Han B et al, AJSP, 2010	0 %	75 %		
Lotan TL et al, Mod Pathol, 2013	13 %	58 %	0 %	84 %
Morais CL et al, AJSP, 2015	0 %	58 %	0 %	76 %
Morais CL et al, Hum Pathol, 2016	7 %		0 %	
Hickman RA et al, AJSP, 2017	7 %	61 %	8 % (Partial loss)	75 %
Shah RB et al, Histopathol, 2017	15 %	55 %	5 %	72 %

**PTEN loss can be utilized as a surrogate marker of IDC-P**

**Case 1: Atypical intraductal proliferation**

# Pathology outcomes of AIP detected in prostate biopsy without an associated IDC-P and cribriform pattern 4

**Table 2: Breakdown of adverse pathology at follow up in 40 patients who were potential candidates for no therapy (AIP alone) or active surveillance (AIP with Grade Group 1 or Grade Group 2 prostate cancer without cribriform Gleason pattern 4)**

Category [n (%)]	Available Follow-Up [n]	Follow-Up Biopsy [n (%)]				Radical Prostatectomy [n (%)]					
		IDC- P	IDC-P + PCa	PCa (≥ GG 3)	Total	≥ GG 3	ICD- P	EPE	SV Invasion	Cribriform GP4	Total
<b>AIP alone 12 (30)</b>	<b>6</b>		<b>1 (17)</b>	<b>2 (33)</b>	<b>3 (50)</b>	<b>NA</b>					
<b>GG 1 10 (25)</b>	<b>3 (1 Bx, 2 RP)</b>				<b>0 (0)</b>		<b>1 (50)</b>	<b>1 (50)</b>		<b>1 (50)</b>	<b>2 (67)</b>
<b>GG 2 without cribrifor m pattern 18 (45)</b>	<b>11 (all RP)</b>					<b>2 (18)</b>	<b>9(81)</b>	<b>9 (81)</b>	<b>1 (8)</b>	<b>8 (72)</b>	<b>11 (100)</b>

**AIP is a marker of unsampled IDC-P and other adverse pathological features at radical prostatectomy**

**Case 2: PCA, Gleason score 3+3=6 with extensive intraductal spread**

# WHEN TO PERFORM BASAL CELL STAINING?

- Lack of definitive infiltrative carcinoma with a suggestion of intraductal carcinoma
- In setting of low grade infiltrative carcinoma where documentation of intraductal carcinoma is necessary to correctly assign Gleason score to case
- Not recommended in the setting of already high-grade PCa

**Case 2: PCA, Gleason score 4+4=8 with intraductal features**

# Ductal Adenocarcinoma of the Prostate

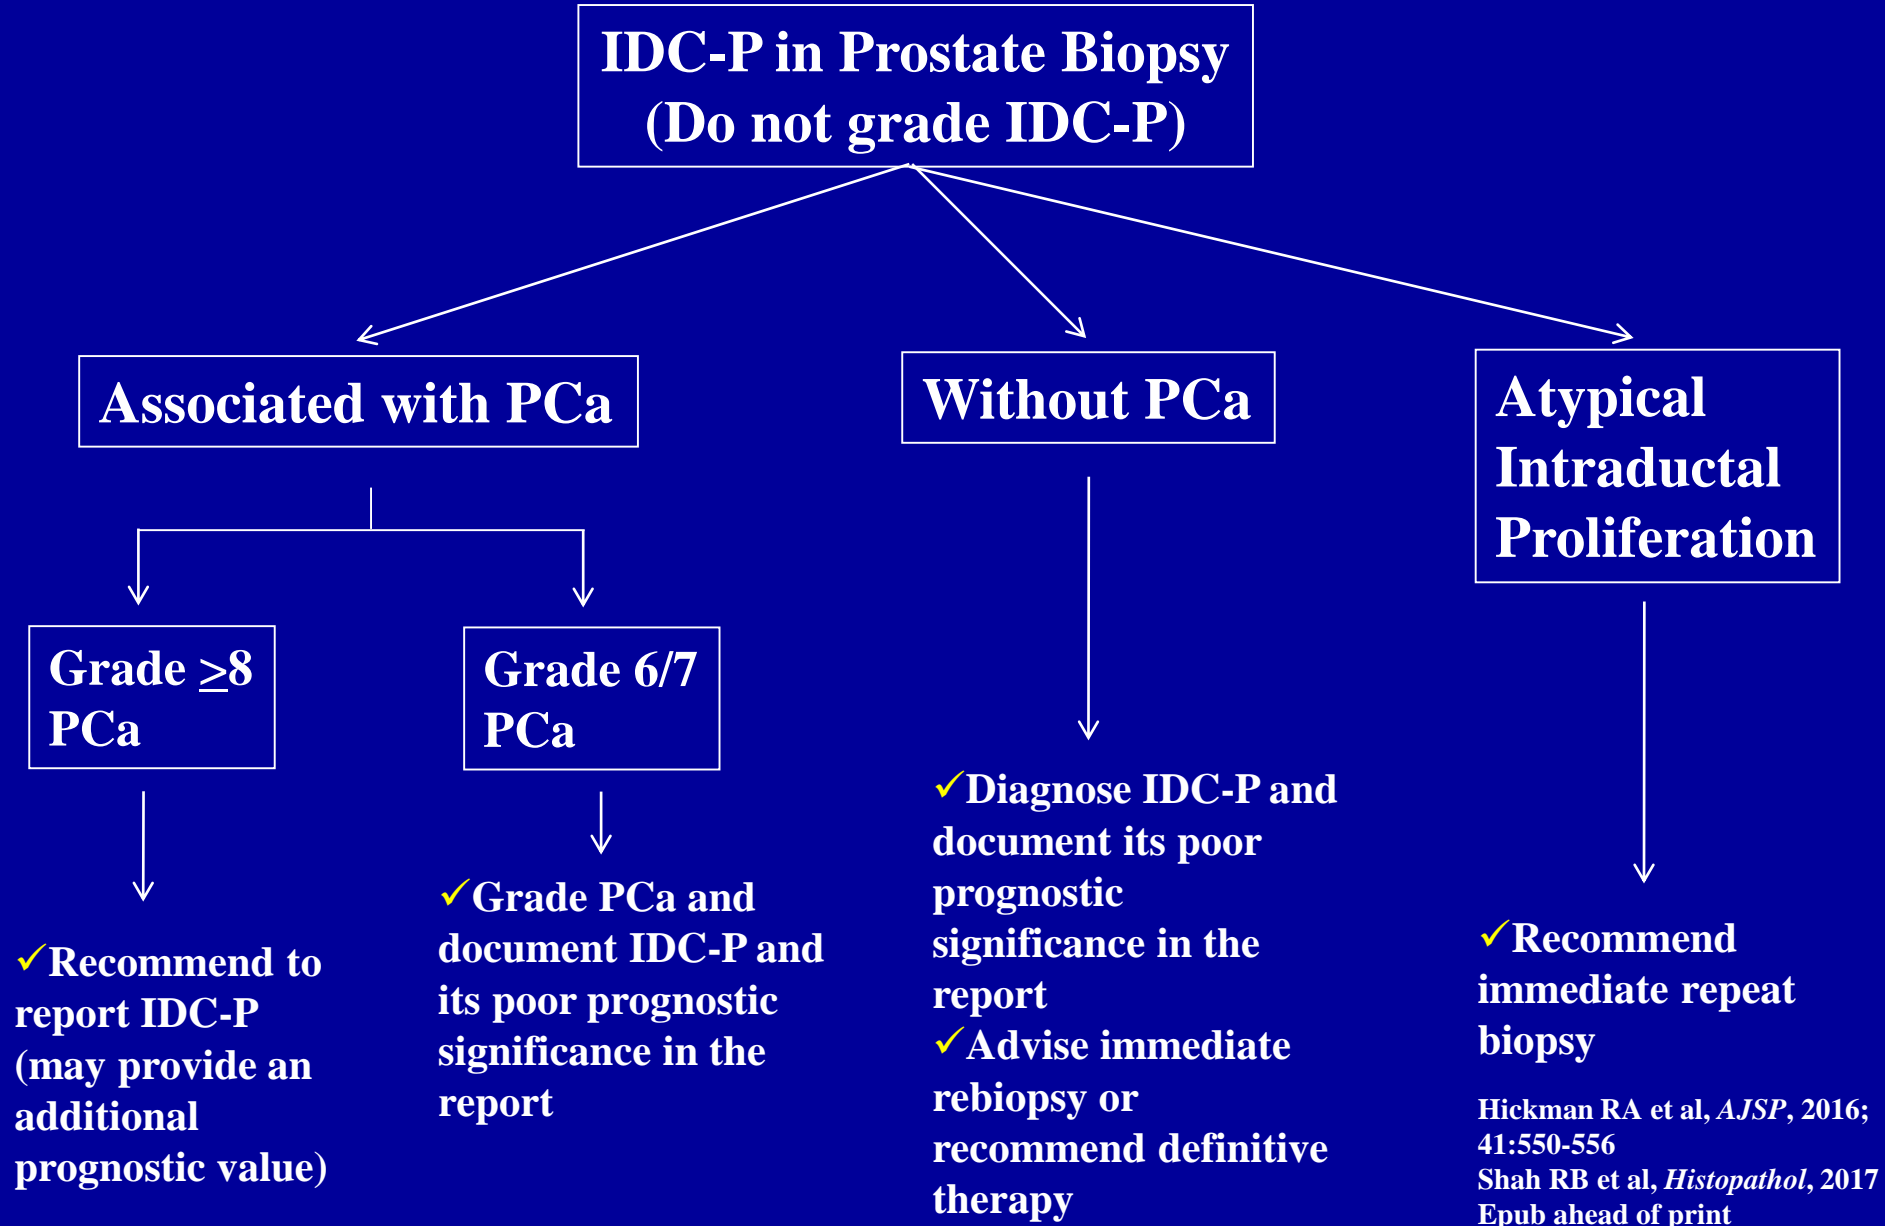

**Ductal Adenocarcinoma of the Prostate with residual basal cells: Intraductal spread**

**K903**

# Reporting Recommendations for Prostate Biopsy with IDC-P

# Ideal Grading System

- Prognostic ability exceeding clinical parameters
- Reproducibility among pathologists
- Grading on biopsy representative of entire cancer

# EVOLUTION OF GLEASON GRADING

1967

2005

**Key Changes: Definitional and Operational**

**Similarity: Gleason grading remains a mid to low power (not high power) exercise!**

# 2005 Modifications of Gleason Grading

- Definition
  - ✓ Gleason pattern 1 and 2 should not be assigned to needle biopsy
  - ✓ Poorly formed glands included as pattern 4
  - ✓ Large cribriform cancer glands separated from pattern 3 and included as pattern 4
  - ✓ Grading new entities/variants: small glomeruloid glands included as pattern 3 while large glomeruloid glands included as pattern 4

# 2005 Modifications of Gleason Grading

- Operational
  - ✓ Secondary pattern of lower grade when of limited extent
  - ✓ Secondary pattern of higher grade when of limited extent
  - ✓ Tertiary pattern
  - ✓ Percent pattern 4/5
  - ✓ Multifocal tumors
  - ✓ Needle biopsy with different cores showing different grades

# EVOLUTION OF GLEASON GRADING

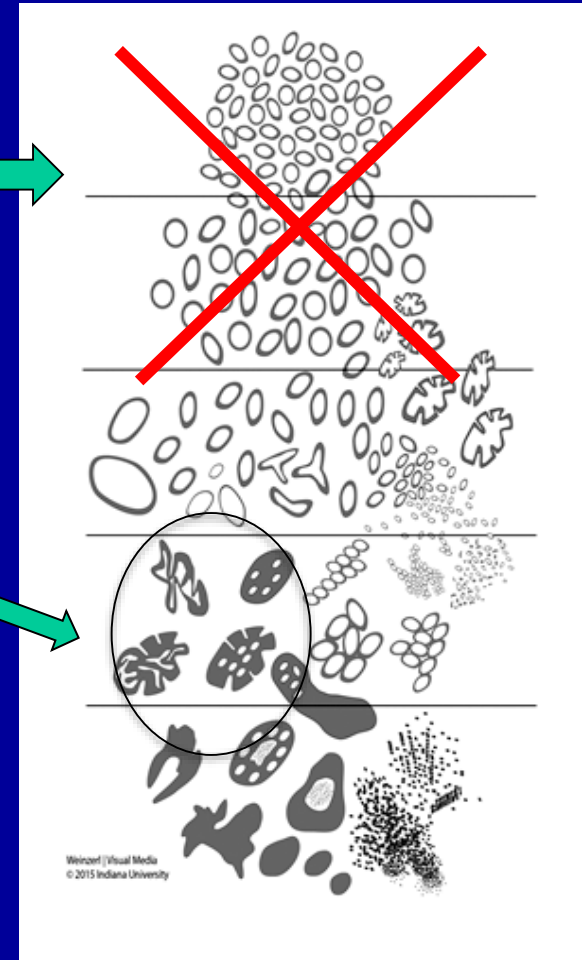

1967

2005

2014

**Key Changes: Definitional and Operational**

**Similarity: Gleason grading remains a mid to low power (not high power) exercise!**

# 2014 Modifications of Gleason Grading

- Definition
  - ✓ All cribriform cancer regardless of size included as Pattern 4
  - ✓ Glomerulations regardless of size included as pattern 4
  - ✓ Intraductal carcinoma (IDC-P) should be reported but not graded

# PROBLEMS WITH CURRENT GLEASON GRADING SYSTEM

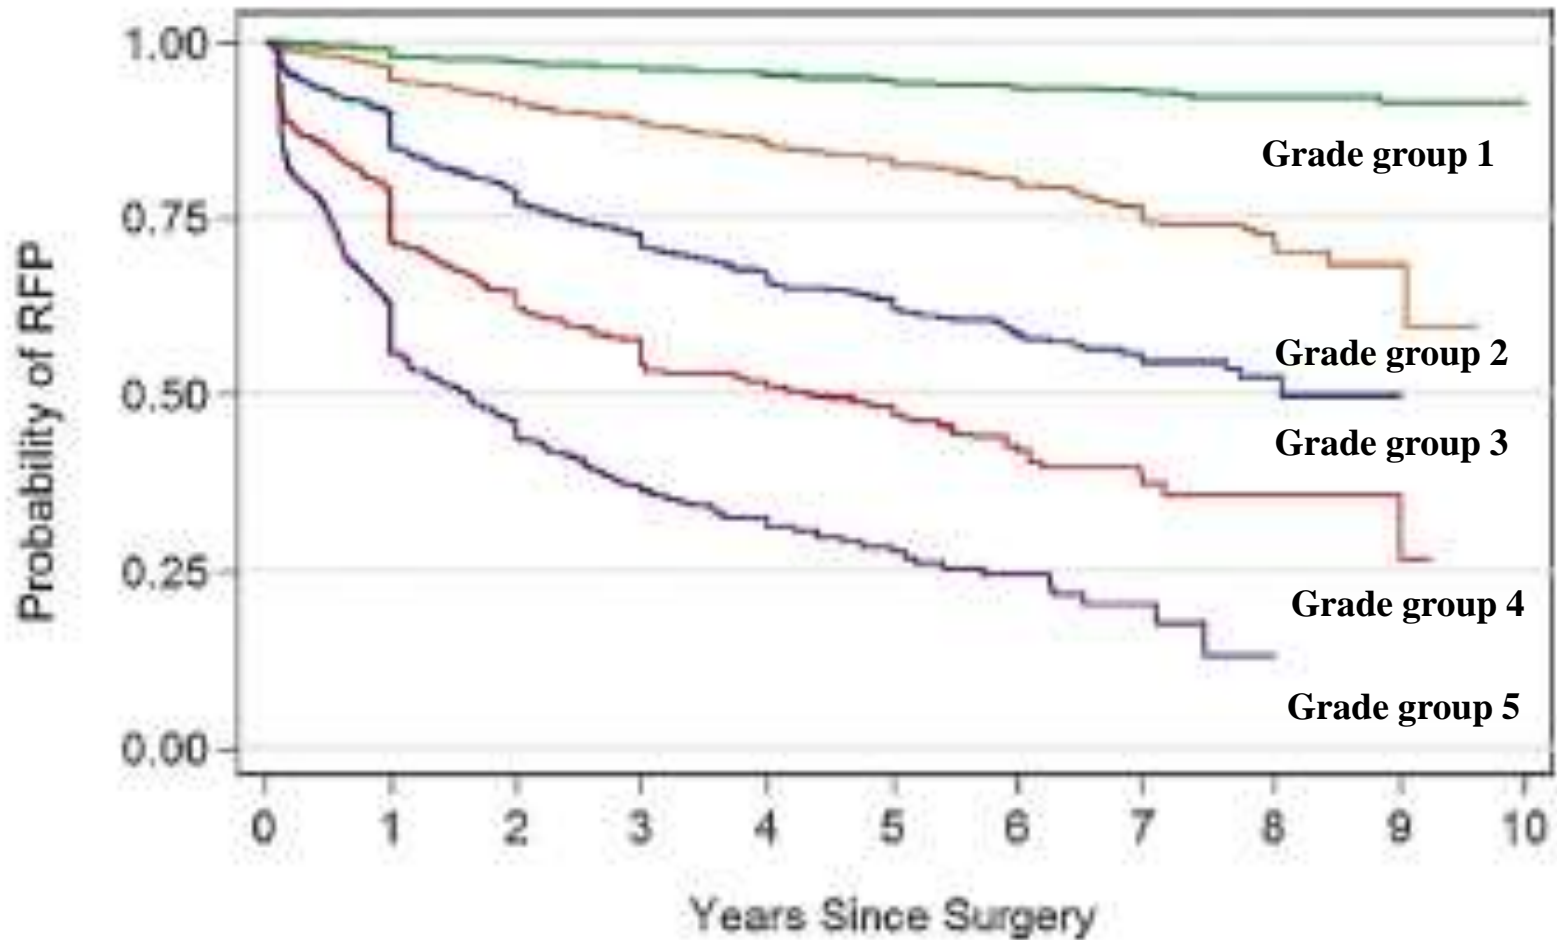

- 6 is the middle of the 2-10 numerical scale but is the lowest score reported
- Patients incorrectly may think that they have a tumor in the middle of the grade spectrum, contributing to the fear of cancer
- Gleason score often grouped into 3 tiers (6, 7, 8-10) for prognostic and therapeutic purposes despite the fact that GS 3+4 vs. 4+3 and 8 vs. 9-10 have significantly different prognosis

# NEW GRADING SYSTEM: GRADE GROUPS

Grade group 1	GS $\leq 6$	Only individual discrete well-formed glands
Grade group 2	GS $3+4=7$	Predominantly well-formed glands with lesser component of poorly-formed/fused/cribriform glands
Grade group 3	GS $4+3=7$	Predominantly poorly-formed/fused/cribriform glands with a lesser component of well-formed glands
Grade group 4	GS $4+4=8$ GS $3+5=8$ GS $5+3=8$	Only poorly-formed/fused/cribriform glands Predominantly well-formed glands with a lesser component lacking glands Predominantly lacking glands or with a lesser component of well-formed glands
Grade group 5	GS 9/10	Lacks gland formation (or with necrosis) with or w/o poorly-formed/fused/cribriform glands

- Proposed by J Epstein (Johns Hopkins)
- Grade grouping NOT A NEW grading method; based on Gleason system; a novel way to group Gleason grades

# OUTCOME OF 20,845 MEN BASED ON BIOPSY GRADE GROUPS

# NEW GRADING SYSTEM: GRADE GROUPS

- Advantages
  - ✓ More accurate stratification than the current system
  - ✓ Lower number of categories (5 vs 10 with Gleason)
  - ✓ Lowest grade is 1 and not 6
- Used in conjunction with the Gleason system
  - ✓ Prostate adenocarcinoma, Gleason score  $3+5=8$   
(Grade group 4)

# WHO Classification of Tumours of the Urinary System and Male Genital Organs

Edited by Holger Moch, Peter A. Humphrey, Thomas M. Ulbright, Victor E. Rauter

# AJCC Cancer Staging Manual

*Eighth Edition*

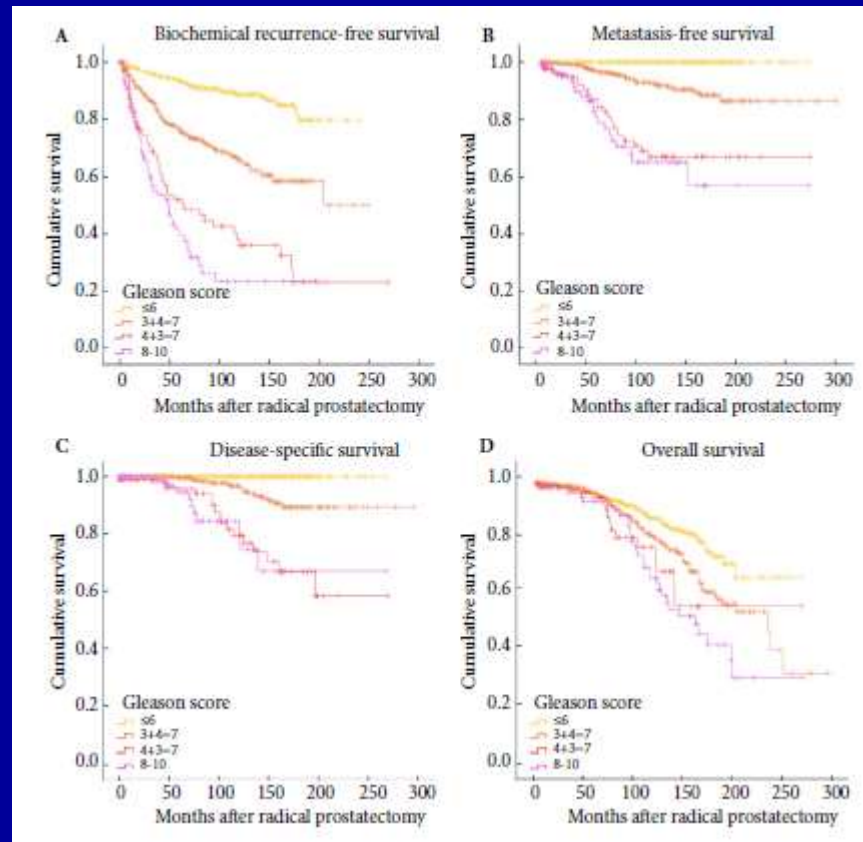

Accepted by  
2016 WHO and  
AJCC.....

Also referred to  
as ISUP grade  
in some  
publications

## Disease-specific death and metastasis do not occur in patients with Gleason score $\leq 6$ at radical prostatectomy

Charlotte F. Kweldam, Mark F. Wildhagen\*<sup>†</sup>, Chris H. Bangma\* and Geert J.L.H. van Leenders

Departments of Pathology, \*Urology, and <sup>†</sup>Research Office Sophia, Erasmus Medical Center, Rotterdam, The Netherlands

# GLEASON PATTERN 4 IN CONTEMPORARY BIOPSY PRACTICE

- Morphologic subpatterns:
  - Poorly formed/Ill-formed
    - Abortive glands
  - Fused glands
  - Glomeruloid (small and large)
  - Cribriform (small and large)
    - Ductal
  - Papillary
    - Ductal
    - Non-ductal

**Ill-defined glands cluster with poorly formed lumina where tangential sectioning is ruled out is Gleason pattern 4**

**How to differentiate “Poorly formed” glands from tangential sectioning?**

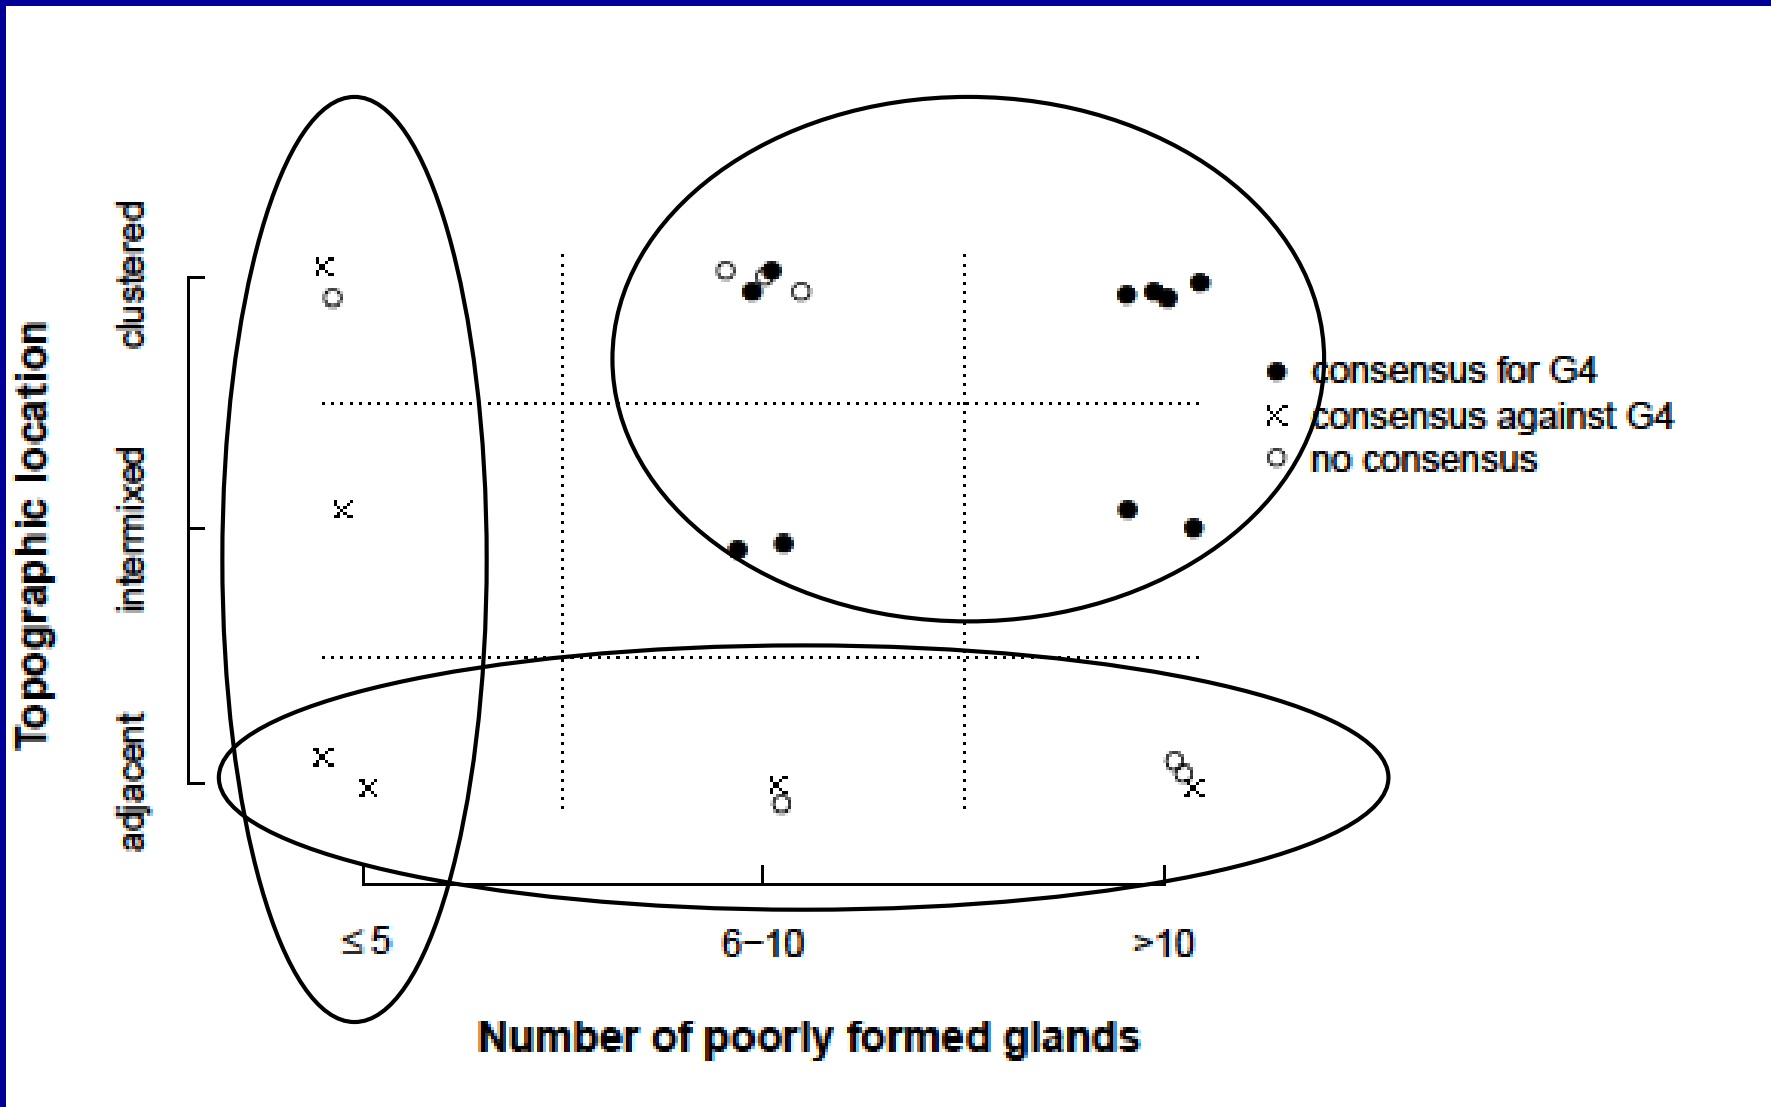

# Diagnosis of “Poorly Formed Glands” Gleason Pattern 4 Prostatic Adenocarcinoma on Needle Biopsy

## *An Interobserver Reproducibility Study Among Urologic Pathologists With Recommendations*

*Ming Zhou, MD, PhD,\* Jianbo Li, PhD,† Liang Cheng, MD, PhD,‡ Lars Egevad, MD,§ Fang-Ming Deng, MD,\* Lakshmi Priya Kunju, MD,|| Cristina Magi-Galluzzi, MD, PhD,† Jonathan Melamed, MD,\* Rohit Mehra, MD,|| Savvas Mendrinou, MD,¶ Adeboye O. Osunkoya, MD,# Gladell Paner, MD,\*\* Steve S. Shen, MD, PhD,†† Toyonori Tsuzuki, MD,‡‡ Kiril Trpkov, MD,§§ Wei Tian, MD,¶¶ Ximing Yang, MD, PhD,||| and Rajal B. Shah, MD¶¶¶*

Am J Surg Pathol 2015; 39 (10):1331-9

- Consensus definition for “poorly formed glands”: Cancer glands with no or rare lumens, elongated compressed glands, and elongated nests
- Kappa=0.34
- Reproducibility improved when quantitative criteria applied

**Use high threshold! Default to grade 3 if in doubt, especially dealing with small focus**

**Case 3: Prostate adenocarcinoma, Gleason score 3+3=6**  
(Poorly formed glands adjacent to well-formed glands, >10, Consensus not pattern 4)

# CRIBRIFORM GLEASON PATTERN 4

- All cribriform cancers (large and small) are pattern 4

## Digital Quantification of Five High-Grade Prostate Cancer Patterns, Including the Cribriform Pattern, and Their Association With Adverse Outcome

Kenneth A. Iczkowski, MD,<sup>1</sup> Kathleen C. Torkko, PhD,<sup>1</sup> Gregory R. Kotnis, MD,<sup>1</sup>  
 R. Storey Wilson, MS,<sup>1</sup> Wei Huang, MD,<sup>2</sup> Thomas M. Wheeler, MD,<sup>3</sup> Andrea M. Abeyta,<sup>1</sup>  
 Francisco G. La Rosa, MD,<sup>1</sup> Shelly Cook, MD,<sup>2</sup> Priya N. Werahera, PhD,<sup>1</sup> and M. Scott Lucia, MD<sup>1</sup>

The presence of cribriform cancer conferred highest odds ratio for PSA failure, 5.9, among five high-grade patterns

**Figure 11** Nine histologic prostate cancer patterns were annotated in the study (H&E, ×100). **A**, The 5 pattern, single small acini. **B**, The 6 pattern, luminal layer mucin-containing single, separate acini. **C**, The 7 pattern, cribriform, branched, or elongated larger acini that are not truly papillary—no bridging or stromal cores. **D**, The 7 pattern, fused small acini. **E**, The 7 pattern, two papillary with stromal cores or bridging across acinar spaces. **F**, The 8C pattern, small cribriform, defined as rounded acinar spaces with a 12 o'clock and no solid area. **G**, The 8C pattern, large cribriform, with more spreading, cribriform to locally solid formations. **H**, The 9 pattern, individual cells. **I**, The 10 pattern, mucinous/colloid carcinoma without fusion or individual cells.

### Presence of Nine Histologic Prostate Cancer Patterns and Their Association With PSA Failure in 153 Cases<sup>†</sup>

Pattern	Present	PSA Failure (n = 76)	Non-PSA Failure (n = 77)	P (χ <sup>2</sup> )	OR for PSA Failure	95% CI	P for OR
Low-grade (S, B, U, and M)	All, 151 (98.7) S, 151 (98.7) B, 78 (51.0) U, 122 (79.7) M, 9 (5.9)	75 (99)	76 (99)	.754 <sup>†</sup>	0.314	0.018-5.464	.427
Fused small	128 (83.7)	68 (89)	60 (78)	.053	1.403	0.499-3.945	.521
Papillary	80 (52.3)	50 (66)	30 (39)	.0009	2.155	0.999-4.645	.050
Individual	35 (22.9)	25 (33)	10 (13)	.003	2.654	1.069-6.589	.035
All cribriform	58 (37.9)	46 (61)	12 (16)	<.0001	5.891	2.534-13.698	<.0001
Any large	58 (37.9)	46 (61)	12 (16)	<.0001	5.583	2.416-12.901	<.0001
Any small	26 (17.0)	21 (28)	5 (6)	.0005	6.062	1.931-19.037	.002
Large acinar <sup>‡</sup>	17 (11.1)	15 (20)	2 (3)	.0007	10.806	2.152-54.256	.004

# Cribriform cancer and biochemical recurrence

TABLE 1. Biochemical Recurrence\* of Prostate Cancer Containing Gleason 4

Studies	Median Follow-up (y)	BCR or Cancer-specific Survival
<b>Prostatectomy:</b>		
Iczkowski et al <sup>7</sup>	5.9	BCR: cribriform had the highest odds ratio among 5 high-grade prostate cancer patterns for PSA failure, OR = 5.89, $P < 0.0001$
Dong et al <sup>10</sup>	5	BCR in 32% of cribriform and 21% of noncribriform ( $P = 0.009$ ); cribriform predicts recurrence, OR = 2.4, $P = 0.003$
Trudel et al <sup>11</sup>	10.8	BCR: presence of cribriform or IDC confers OR = 3.0, $P = 0.0002$ . Independent predictor of BCR, along with Gleason $\geq 8$ and positive margin
Kir et al <sup>13</sup>	3.5	96% of BCR-positive cases had cribriform pattern, vs. 57% of BCR-negative. Cribriform pattern is independent BCR predictor, OR = 11.9, $P = 0.02$
Choy et al <sup>23</sup>	6.3	BCR: cribriform 30%; poorly formed 22%; fused 19%
Choy et al <sup>24</sup>	5	In prostatectomy 3+4 cancer with low volume, BCR: If tumor volume $< 5\%$ : 5% no cribriform; 18% cribriform. If tumor volume $< 10\%$ : 15% no cribriform; 18% cribriform
Kweldam et al <sup>17</sup>	15	Cancer-specific survival, 94% in cribriform/IDC-, and 67% in cribriform/IDC+, OR = 2.8
Choy et al <sup>25</sup>	1.5	Cribriform or IDC associated with BCR, OR = 2.2
<b>Biopsy:</b>		
Harding et al <sup>8</sup>	2.7	Among Gleason 8 biopsy cases, cribriform pattern predicted BCR, OR = 6.1, $P = 0.018$ . It is more important than 4+4 vs. 3+5
Billis et al <sup>26</sup>	Not given	Time to BCR was less ( $P = 0.49$ ) in biopsy specimens with mixture of patterns than in those with exclusively a fused pattern

\*Generally defined as a postoperative rise in serum PSA to  $\geq 0.2$  ng/mL.

BCR indicates biochemical recurrence; IDC, intraductal carcinoma; OR, odds ratio; PSA, prostate-specific antigen.

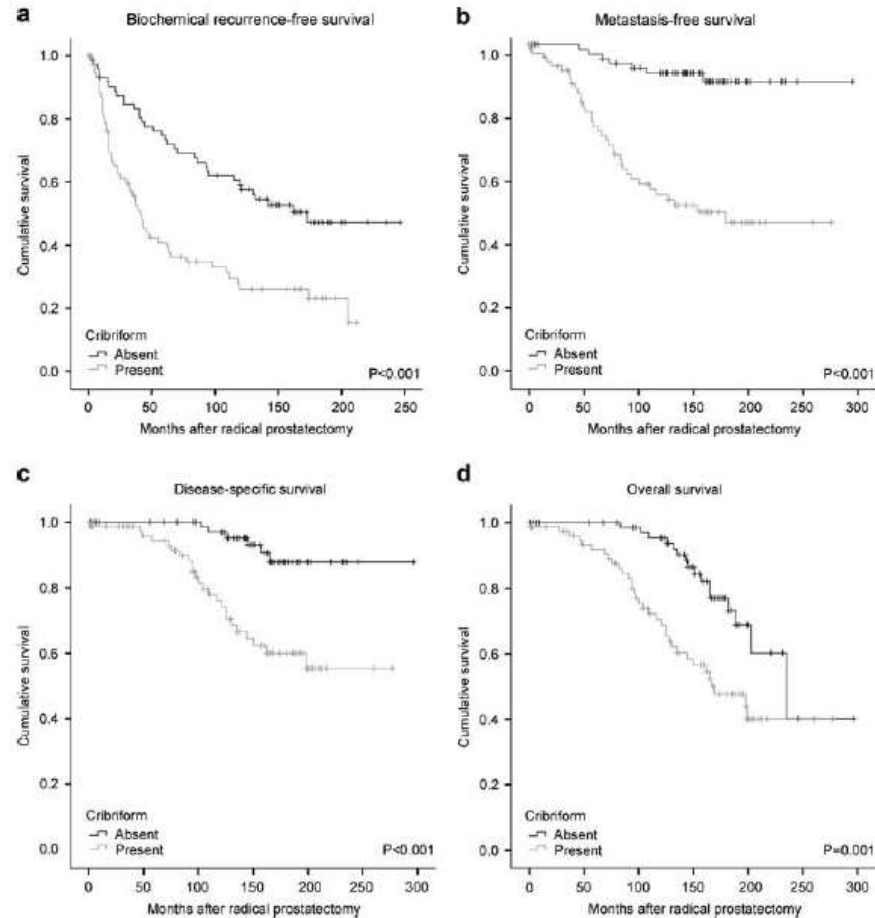

# Cribriform cancer and prediction of metastasis and death

**TABLE 2.** Systemic Metastasis and Cancer-specific Death From Prostate Cancer

Studies	Median Follow-up (y)	Metastasis	Cancer-specific Death
<b>Prostatectomy:</b>			
Dong et al <sup>10</sup>	10	Grade 4 cribriform 13.3% vs. without cribriform 2.6%, OR = 5.6, <i>P</i> = 0.02	
Kweldam et al <sup>16</sup>	10	Cribriform pattern was the only independent predictor for metastasis, OR = 8.0, <i>P</i> < 0.001	Other than Gleason score, cribriform pattern was only independent predictor for metastasis, OR = 5.4, <i>P</i> < 0.001
Choy et al <sup>25</sup>	10	<u>Cribriform or IDC associated with BCR</u> , OR = 3.3, <i>P</i> < 0.001	
<b>Biopsy:</b>			
Kweldam et al <sup>17</sup>	15		If cribriform absent 94%; if present 67%. OR = 2.6, <i>P</i> = 0.002. A 3+4 = 7 cancer without cribriform was not significantly different from 3+3 = 6

## Cribriform growth is highly predictive for postoperative metastasis and disease-specific death in Gleason score 7 prostate cancer

Charlotte F Kweldam<sup>1</sup>, Mark F Wildhagen<sup>2,3</sup>, Ewout W Steyerberg<sup>4</sup>, Chris H Bangma<sup>3</sup>, Theodorus H van der Kwast<sup>5</sup> and Geert JLH van Leenders<sup>1</sup>

**Figure 2** Kaplan–Meier estimates on impact of cribriform growth pattern in (a) biochemical recurrence-free survival; (b) distant metastasis-free survival; (c) disease-specific survival; and (d) overall survival.

A. Left base x 2 prostate, biopsy - Adenocarcinoma of prostate, Gleason score 3+4=7, grade group 2, involving one of two cores (25%, 2.5 mm; 15% of sampled tissue).

B. Left mid x 2 prostate, biopsy - Adenocarcinoma of prostate, Gleason score 3+4=7, grade group 2, involving one of two cores (60%, 7 mm, 45% of sampled tissue).

C. Left apex x 2 prostate, biopsy - Benign prostatic tissue.

D. Right base x 2 prostate, biopsy - Adenocarcinoma of prostate, Gleason score 4+3=7, grade group 3, involving two cores (90%, 6 mm, 15%, 2 mm; 45% of sampled tissue).

- Gleason pattern 4 accounts for 80% of the tumor.

E. Right mid x 2 prostate, biopsy - Adenocarcinoma of prostate, Gleason score 3+4=7, grade group 2, involving one of two cores (35%, 4 mm; 20% of sampled tissue).

F. Right apex x 2 prostate, biopsy - Minute focus of adenocarcinoma of prostate, Gleason score 3+3=6, grade group 1, involving one of two cores (2%, less than 0.5 mm).

G. Target 1 prostate, biopsy - Benign prostatic tissue.

H. Target 2 prostate, biopsy - Adenocarcinoma of prostate, Gleason score 4+3=7, grade group 3, involving four cores (100%, 6 mm, 100%, 5 mm, 95%, 7 mm, 75%, 6 mm; 85% of sampled tissue).

- Gleason pattern 4 accounts for 50% of the tumor.

- Perineural invasion present.

#### Prostate Cancer Biopsy Summary

Number of cores examined: 18

Number of cores positive: 10

Highest Grade Group: 3

Highest % of core involvement: 100%

Cribriform pattern 4: Absent

Intraductal carcinoma: Absent

# Size of the cribriform glands likely matters!

Modern Pathology

## Large cribriform growth pattern identifies ISUP grade 2 prostate cancer at high risk for recurrence and metastasis

Eva Hollemans<sup>1</sup> · Esther I. Verhoef<sup>1</sup> · Chris H. Bangma<sup>2</sup> · John Rietbergen<sup>3</sup> · Jozien Helleman<sup>2</sup> · Monique J. Roobol<sup>1,2</sup> · Geert J.L.H. van Leenders<sup>1</sup>

Received: 29 June 2018 / Revised: 22 August 2018 / Accepted: 23 August 2018  
© The Author(s) 2018

### Various definition of large cribriform gland:

- 1) > 12 lumens
- 2) Two times benign gland
- 3) > 0.5 mm

# Ductal Adenocarcinoma of the Prostate

# Glomeruloid structures – Now uniformly Gleason pattern 4

**Common pitfalls that may result  
in over grading of Pattern 3 as 4**

**Microacinar morphology mimicking “poorly formed” pattern 4**

**Tangentially sectioned glands mimicking “poorly formed” pattern 4**

**Branching of glands mimicking “fused” pattern 4**

**Mucinous fibroplasia mimicking cribriform pattern 4**

**Mucinous extravasation with collapsed stroma mimicking cribriform pattern 4**

**Crowded small well formed glands mimicking cribriform pattern 4**

**Telescoping (Gleason 3) mimicking Glomerulation pattern 4**

**Pseudopapillary pattern in Pseudohyperplastic PCA mimic pattern 4**

**Adenocarcinoma with mucinous differentiation – Grade based on architecture, Default grade is NOT Gleason pattern 4**

**PIN-like ductal without papillary or cribriform architecture is NOT Gleason pattern 4**

# GLEASON PATTERN 5 IN CONTEMPORARY BIOPSY PRACTICE

- Morphologic subpatterns:
  - Infiltrating cords
  - Single cells
  - Solid Sheets
  - Comedocarcinoma
  - Linear arrays and solid nests
- Infiltrating cords and single cells most common; frequently co-exist
- Tertiary distribution most common presentation
- Pattern 5 under recognized in practice ( Al-Hussain TO et al, Urology 2012;79:178-181)

# ISSUES WITH GLEASON PATTERN 5

- Solid nests: Size
- Single cells/cords:
  - Quantity
  - Topographic location (relationship with other pattern 4)
- Comedocarcinoma
  - True necrosis versus secretions
- Variant histology
  - Signet ring cell-like
  - Neuroendocrine differentiation

# Diagnosis of Gleason Pattern 5 Prostate Adenocarcinoma on Core Needle Biopsy

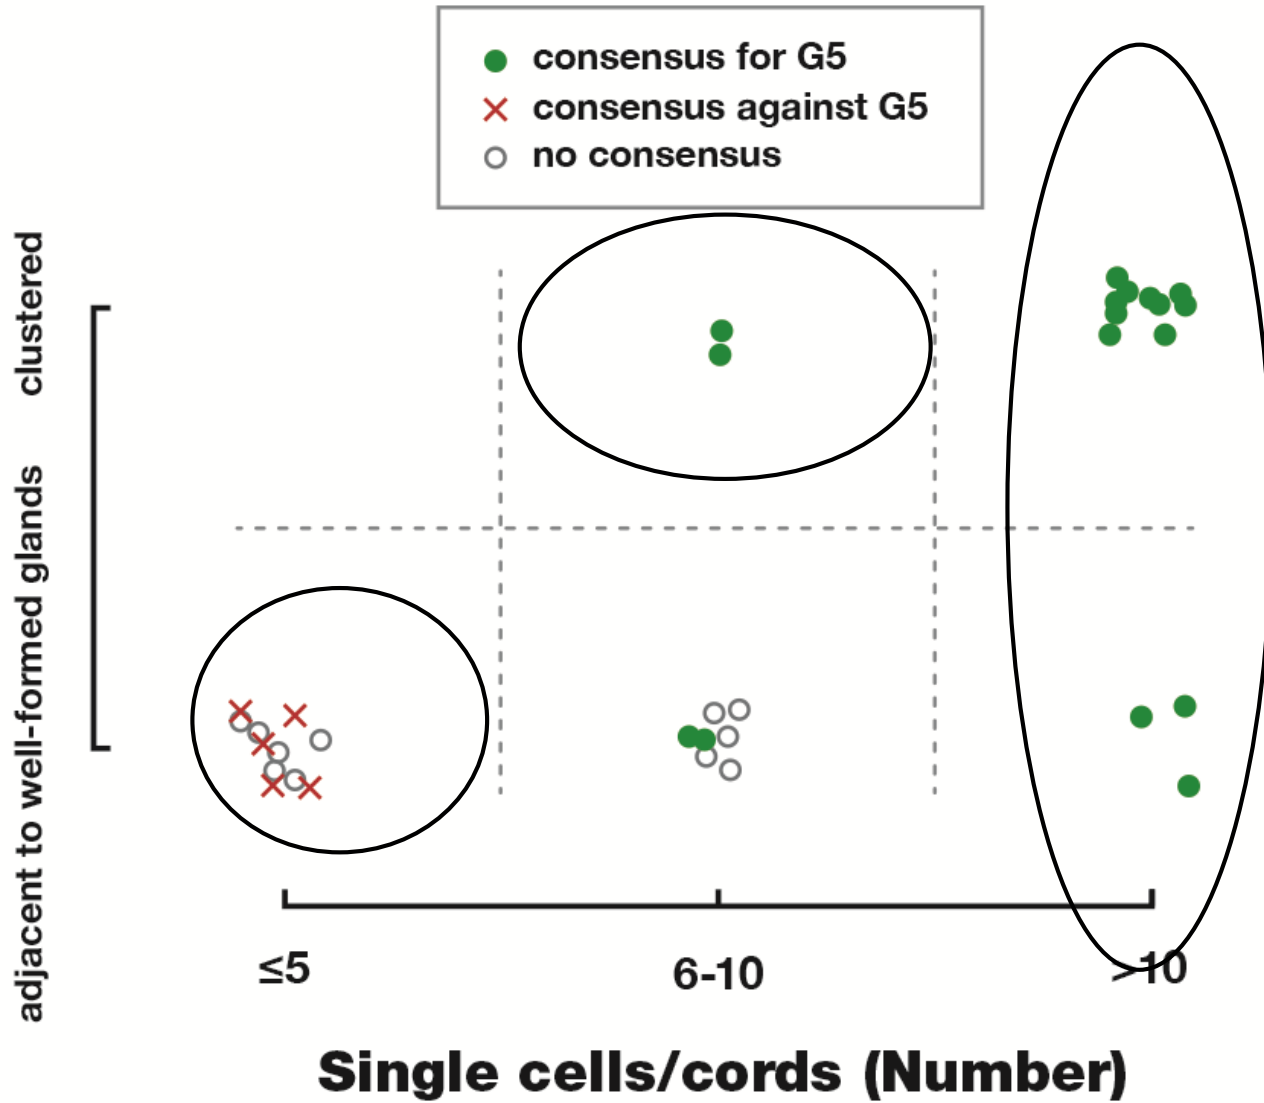

## *An Interobserver Reproducibility Study Among Urologic Pathologists*

*Rajal B. Shah, MD,\* Jianbo Li, PhD,† Liang Cheng, MD, PhD,‡ Lars Egevad, MD,§  
Fang-Ming Deng, MD,|| Samson W. Fine, MD,¶ Lakshmi P. Kunju, MD,# Jonathan Melamed, MD,||

and Ming Zhou, MD, PhD||*

*Am J Surg Pathol* 2015; 39 (9):1242-1249

- Overall Kappa=0.376
- Among sub patterns, comedocarcinoma had highest reproducibility (k=0.499), followed by variant morphology (k=0.443), single cells/cords (k=0.369), and nests (k=0.347)
- Reproducibility improved when restrictive morphologic and quantitative criteria applied

# Topographic Location

**Prostate adenocarcinoma, Gleason score 5+4=9**  
(Single cells/cords >10; clustered or intermixed with glands; Consensus for pattern 5)

**Case 4: Prostate adenocarcinoma, Gleason score 4+3=7**  
(Single cells/cords  $\leq 5$ ; Consensus against pattern 5)

**Large nests with or without glandular differentiation (Consensus for 5)**

**Comedonecrosis with or without karyorrhectic debris (Consensus for 5)**

**Signet ring cell-like cells in single cells or in nests (Consensus for 5)**

**Paneth cell change within nests (consensus against 5)**

# REPORTING

# WHO 2016 RECOMMENDATION: REPORT % GLEASON PATTERN 4

- Percentage of high-grade pattern 4/5 proposed as significant prognosticator (JAMA 281;1395, 1999)
- Mainly tested in RP setting but recent studies show similar impact at biopsy
- May have implications for active surveillance and radiation therapy
- Can improve risk stratification even in 3+4 vs. 4+3 subsets of Gleason score 7
- Not established : increments to use

# IMPACT OF LOW (< 10%) GLEASON 4 IN 3+4 PROSTATE CANCER IN BIOPSY

- No/minimal impact of < 5% or 10% Gleason pattern 4 in 7s.
- Lack of significant risk of adverse pathology among Gleason 7 patients when G4% is 5% or 10%; however is markedly different when G4% reaches 20% (J Urol Feb 2016)
- 3+3=6 vs. 3+4=7 with  $\leq 5\%$  Gleason grade 4: No difference in pathologic findings in RP (AJSP 38:1096, 2014) and biochemical recurrence ( Ann Diagn Pathol 20:48, 2016)

# Presence of invasive cribriform or intraductal growth at biopsy outperforms percentage grade 4 in predicting outcome of Gleason score 3+4 = 7 prostate cancer

## REPORTING IN NEEDLE BIOPSY:

- 1) Limited (<5%) secondary patterns of lower grade
- 2) Limited higher grade
- 3) Tertiary pattern of higher grade in needle biopsy

$$4+4 = 8$$

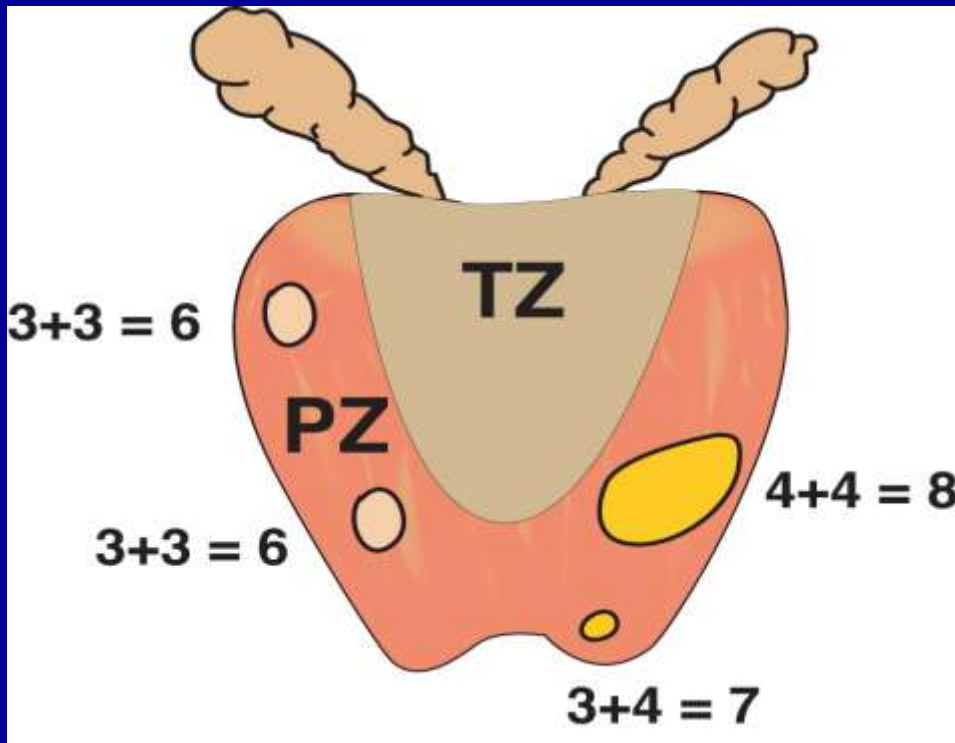

$$3+4 = 7$$

$$3+5 = 8$$

# Multifocal cancer with different Gleason score is common

**Dominant nodule (Index tumor) is reported.**

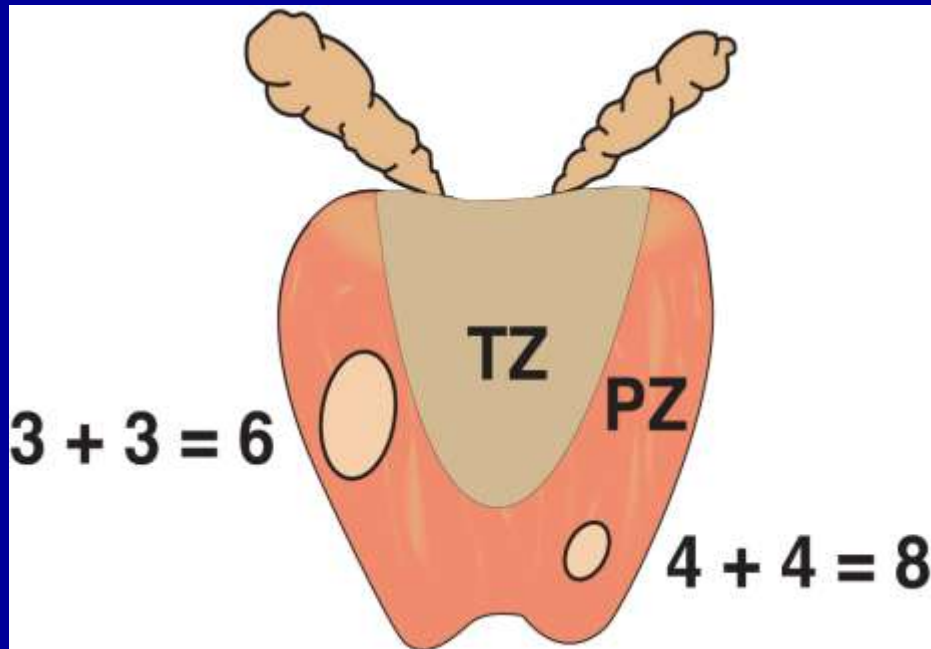

**Not necessary to report small, organ-confined GS 3+3 foci**

**4+4=8 NOT 4+3=7**

# MULTIPLE DOMINANT NODULES

# NON-DOMINANT NODULE OF HIGHER GRADE

**Multiple nodule with non-concurrent path parameters:**

**Each major tumor nodule should be graded separately**

**Two foci of cancer,  $4+4=8$  and  $3+3=6$ . NOT  $3+4=7$**

Anterior

# REPORTING TERTIARY GRADE/PATTERN IN RP

- Reporting approach different than biopsy
- Reported as tertiary pattern as long as higher than primary or secondary pattern
- Some experts consider tertiary pattern only  $<5\%$  of tumor
- Some would assign it as tertiary pattern even it is  $>5\%$  as long as the highest pattern is tertiary in quantity
- Both approaches are OK as long as understood by your urologists.

# STAGING

# STAGING: T2 SUBSTAGING

- Clinical stage T2 is considered as T2a-c based on DRE
- Pathological stage T2 is no longer substaged due to lack of prognostic significance

# BLADDER NECK INVOLVEMENT

## Microscopic bladder neck involvement

(Zhou M et al, Mod Pathol, 2009)

- ✓ Presence of cancer glands within smooth muscle bundles of coned bladder neck without benign prostate glands
- ✓ Staged as pT3a, not pT4

Gross bladder neck involvement: T4

# GLEASON GRADE/GROUP IMPORTANT PART OF STAGING

TABLE 4. American Joint Committee on Cancer Prognostic Stage Grouping<sup>a</sup>

WHEN T IS...	AND N IS...	AND M IS...	AND PSA IS...	AND GRADE GROUP IS...	THEN THE STAGE GROUP IS...
cT1a-c, cT2a	N0	M0	<10 ng/mL	1	I
pT2	N0	M0	<10 ng/mL	1	I
cT1a-c, cT2a	N0	M0	≥10, <20 ng/mL	1	IIA
pT2	N0	M0	≥10, <20 ng/mL	1	IIA
cT2b-c	N0	M0	<20 ng/mL	1	IIA
T1-2	N0	M0	<20 ng/mL	2	IIB
T1-2	N0	M0	<20 ng/mL	3	IIC
T1-2	N0	M0	<20 ng/mL	4	IIC
T1-2	N0	M0	≥20 ng/mL	1-4	IIIA
T3-4	N0	M0	Any	1-4	IIIB
Any T	N0	M0	Any	5	IIIC
Any T	N1	M0	Any	Any	IVA
Any T	Any	M1	Any	Any	IVB

Abbreviation: PSA indicates prostate-specific antigen. <sup>a</sup>Note that, when either PSA or grade group is not available, grouping should be determined by T category and/or either PSA or grade group, as available.

# TAKE HOME MESSAGES

- Report intraductal carcinoma; do not grade
- Report the presence or absence of cribriform Gleason pattern 4
- Gleason grade and Grade groups are both required for reporting
- % pattern 4 should be reported for Gleason 7 carcinoma
- Further optimization of grade groups is expected

# TAKE HOME MESSAGES

- In needle biopsy when tertiary pattern is higher than primary or secondary, it should be included in final GS as secondary pattern; No specific recommendation for radical prostatectomy
- Radical prostatectomy with multiple tumors: dominant tumor is reported; for non-dominant nodule of higher grade, each major tumor graded separately
- pT2 is no longer substaged into T2a-c
